

## Shrimp error display

Sample screen shot showing shrimp errors in the SLIDE (Eclipse) problem view.

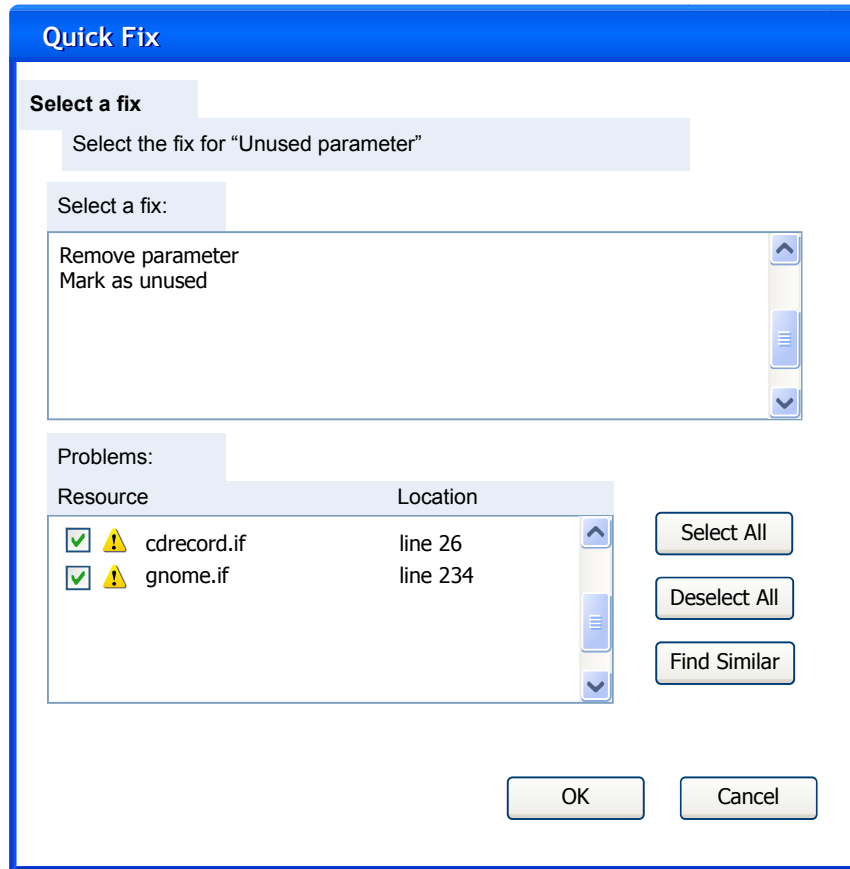

The warning is shown in the SLIDE module editor with the yellow warning icon on the left and underlined. All options on the right click menu are standard.

- Go To opens the editor to the problem selected
- Show In is used to show the file in other views if available
- Copy is used to copy the error to the clipboard
- Select All is used to select all problems
- Quick Fix is used to suggest possible fixes for the problems (see next page)
- Properties shows a dialog with the problem description

## Shrimp error display

This shows the Eclipse 'Quick Fix' dialog which is available when the 'Quick Fix' item is selected from the right click menu from the problem view.

The dialog allows the user to select possible fixes for the problem selected. In this case 'Unused parameter' the user can either choose to remove the parameter or mark the parameter as unused.

The 'remove parameter' choice would remove the parameter from the XML. The 'mark as unused' choice would modify the XML to note the parameter is not used. Other warnings would get different suggestions. Some warnings may not be able to be fixed this way in SLIDE.
